

Sensing the World Reflection

This week of lab was my first week in ENGR-95. I loved it. I loved how we jumped straight into real applications of what the module is about. Although I didn't know a thing about chips or sensors and feel like the module is more for computer and electrical engineers I still have fun every day in class. I find it fascinating and enjoy learning something new. I thought it was cool that we were doing hands-on applications to learn basic principles. On my first day we calculated the resistivity of different conductive materials. We cut out a small rectangle out of tape on a glass slider and deposited different conductive materials like silver paste, carbon paint, and silver paint. Using an ohmmeter we could calculate for resistivity from resistance.

The professors and TAs are really helpful and explain everything well. Even if I am lost like a little kid in Target they come in with a saving grace of knowledge. I also thought it was super fascinating when we got a tour of Sinclair Lab. I felt like I was suiting up to go on a rocket ship. The manufacturing part of the chip making process was very interesting. My mind was blown when they were explaining that the process was operating at microns thick. Afterwards, we went downstairs and learned about how the machine regulates temperature and pressure to create an environment to grow the materials for the wafers. I was proud when I was explaining to my mom about all the cool stuff I'm learning in college.
